- ☐ [Specific Intratumoral Microbiome Signatures in Human Glioblastoma and Meningioma: Evidence for a Gut–Brain Microbial Axis](#)
1. [Specific Intratumoral Microbiome Signatures in Human Glioblastoma and Meningioma: Evidence for a Gut–Brain Microbial Axis](#)
- (Submitter supplied) Brain tumors (BTs), including **glioblastoma** (GBM) and meningioma (MGM), contribute significantly to the global cancer burden. The microbiome has been implicated in carcinogenesis, yet its role in BTs remains underexplored. We performed 16S rRNA gene sequencing of the gut microbiota (GM) and intratumoral microbiome (ItM) from fresh tissue samples of 9 patients with GBM and 18 with MGM. 12 age- and sex-matched healthy controls (HCs) were also enrolled. Series Accession: GSE303995 ID: 200303995

- ☐ [Tumor-infiltrating lymphocytes-derived CD8+ clonotypes infiltrate the tumor tissue and mediate tumor regression in glioblastoma \[WES\]](#)
2. [Tumor-infiltrating lymphocytes-derived CD8+ clonotypes infiltrate the tumor tissue and mediate tumor regression in glioblastoma \[WES\]](#)
- (Submitter supplied) IL-2/IL-15/IL-21-expanded TILs achieved complete tumor regression in a hypermutated **glioblastoma** patient, overcoming the immunosuppressive microenvironment. This case highlights a novel approach for treating gliomas using tailored adoptive cell therapy strategies.

Organism: **Homo sapiens**
